When it comes to image editing, the first step most photographers make is to sharpen the image. That's how the other step, resizing, starts. When you sharpen an image, you do so with a sharpening filter. This can create a bevy of unwanted artifacts on the image, depending on the settings. My first step in processing photographs is to sharpen the image, so that the next steps are easier. I prefer to sharpen and then downsize the image. Resize the image only after sharpening it. You can tweak the settings after sharpening, but see if the image looks reasonably good without the sharpening first. I have told Adobe that for the time being I do not want Photoshop but I have to admit that Photoshop is one of the best present software I have ever received (and my whole family totally loves it!). It's powerful like a camera, smart like a photographer, precise like a surgeon (ok maybe not that precise [slowly made face, smile, brain damage]). I love the smartness of the combination between RAW-processor and DNG-processor and the colors, the precision of selection and the crafting ability, and the smooth editing. I'm in love with the exposure functionality and the overall design. Any CS5 user can go to the beta and give it a try and you don't need any other software to edit images, you get everything you need and then some. And they made it even easier with the new Split Toning [or so I think]. Sorry, I love my old software, but the new version is Awesome. I have tried the newer versions of Photoshop (CS5 and then CS6) and have found them to be better suited to my work, and the speed much quicker than previous versions. However, I found them to be incredibly buggy. I attribute this to the fact I've been using conventional film cameras from around 1995 and purchased the C500 and the C700, which run the system camera software (Interbecke) and for whatever reason the Canon menus and software just do not translate to RAW files.
